

## DM74LS390 Dual 4-Bit Decade Counter

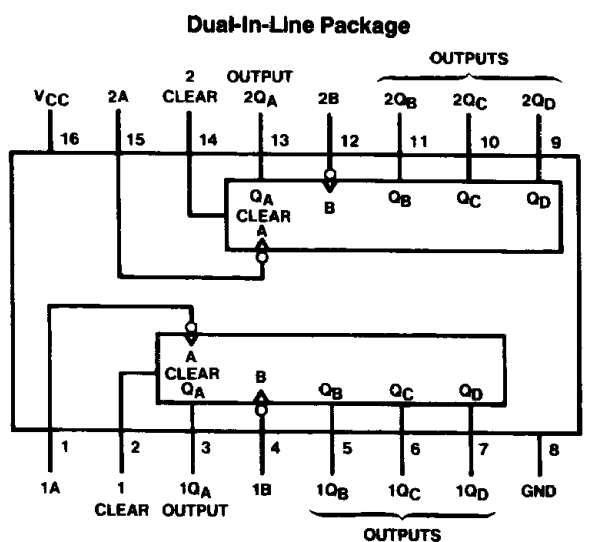

### General Description

Each of these monolithic circuits contains eight master-slave flip-flops and additional gating to implement two individual four-bit counters in a single package. The 'LS390 incorporates dual divide-by-two and divide-by-five counters, which can be used to implement cycle lengths equal to any whole and/or cumulative multiples of 2 and/or 5 up to divide-by-100. When connected as a bi-quinary counter, the separate divide-by-two circuit can be used to provide symmetry (a square wave) at the final output stage. The 'LS390 has parallel outputs from each counter stage so that any submultiple of the input count frequency is available for system-timing signals.

### Features

- Dual version of the popular 'LS90
- 'LS390 ... individual clocks for A and B flip-flops provide dual  $\div 2$  and  $\div 5$  counters
- Direct clear for each 4-bit counter
- Dual 4-bit version can significantly improve system densities by reducing counter package count by 50%
- Typical maximum count frequency ... 35 MHz
- Buffered outputs reduce possibility of collector commutation

**Note A:** Output Q<sub>A</sub> is connected to input B for BCD count.

**Note B:** Output Q<sub>D</sub> is connected to input A for Bi-quinary count.

**Note C:** H = High Level, L = Low Level.

**Absolute Maximum Ratings** (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
