

LF111/LF211/LF311 Voltage Comparators

General Description

The LF111, LF211 and LF311 are FET input voltage comparators that virtually eliminate input current errors. Designed to operate over a 5.0V to ± 15 V range the LF111 can be used in the most critical applications.

The extremely low input currents of the LF111 allows the use of a simple comparator in applications usually requiring input current buffering. Leakage testing, long time delay circuits, charge measurements, and high source impedance voltage comparisons are easily done.

Further, the LF111 can be used in place of the LM111 eliminating errors due to input currents. See the "application hints" of the LM311 for application help.

Features

- Eliminates input current errors
- Interchangeable with LM111
- No need for input current buffering

Input Voltage Range		–13.5	±14	13.0	V
Saturation Voltage	$V^+ \geq 4.5\text{V}$, $V^- = 0$ $V_{IN} \leq -6.0\text{ mV}$, $I_{OUT} \leq 8.0\text{ mA}$		0.23	0.4	V
Output Leakage Current	$V_{IN} \geq 5.0\text{ mV}$, $V_{OUT} = 35\text{V}$		0.1	0.5	μA
Positive Supply Current	$T_A = 25^\circ\text{C}$		5.1	6.0	mA
Negative Supply Current	$T_A = 25^\circ\text{C}$		4.1	5.0	mA

Note 1: This rating applies for ±15V supplies. The positive input voltage limit is 30V above the negative supply. The negative input voltage limit is equal to the negative supply voltage or 30V below the positive supply, whichever is less.

Note 2: The maximum junction temperature of the LF111 is +150°C, the LF211 is +110°C and the LF311 is +85°C. For operating at elevated temperatures, devices in the H08 package must be derated based on a thermal resistance of +65°C/W junction to ambient (in 400 linear feet/min air flow), +165°C/W junction to ambient (in static air), or +20°C/W junction to case.

Note 3: These specifications apply for $V_S = \pm 15\text{V}$, and the Ground pin at ground, and $-55^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$ for the LF111, unless otherwise stated. With the LF211, however, all temperature specifications are limited to $-25^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ and for the LF311 $0^\circ\text{C} \leq T_A \leq +70^\circ\text{C}$. The offset voltage, offset current and bias current specifications apply for any supply voltage from a single 5.0V supply up to ±15V supplies.

Note 4: The offset voltages and offset currents given are the maximum values required to drive the output within a volt of either supply with a 1.0 mA load. Thus, these parameters define an error band and take into account the worst case effects of voltage gain and input impedance.

Note 5: The response time specified (see definitions) is for a 100 mV input step with 5.0 mV overdrive.

Note 6: For input voltages greater than 15V above the negative supply the bias and offset currents will increase—see typical performance curves.

Note 7: This specification gives the current that must be drawn from the strobe pin to ensure the output is properly disabled. Do not short the strobe pin to ground; it should be current driven at 3 to 5 mA.

Note 8: Refer to RETSF111X for LF111H military specifications.
