

54LS173/DM74LS173A TRI-STATE® 4-Bit D-Type Register

General Description

This four-bit register contains D-type flip-flops with totempole TRI-STATE® outputs, capable of driving highly capacitive or low-impedance loads. The high-impedance state and increased high-logic-level drive provide these flip-flops with the capability of driving the bus lines in a bus-organized system without need for interface or pull-up components.

Gated enable inputs are provided for controlling the entry of data into the flip-flops. When both data-enable inputs are low, data at the D inputs are loaded into their respective flip-flops on the next positive transition of the buffered clock input. Gate output control inputs are also provided. When both are low, the normal logic states of the four outputs are available for driving the loads or bus lines. The outputs are disabled independently from the level of the clock by a high logic level at either output control input. The outputs then present a high impedance and neither load nor drive the bus line. Detailed operation is given in the truth table.

To minimize the possibility that two outputs will attempt to take a common bus to opposite logic levels, the output control circuitry is designed so that the average output disable times are shorter than the average output enable times.

Features

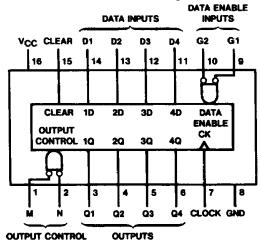

- TRI-STATE outputs interface directly with system bus
- Gated output control lines for enabling or disabling the outputs
- Fully independent clock eliminates restrictions for operating in one of two modes:

Parallel load
Do nothing (hold)

For application as bus buffer registers

Function Table

Clear	Clock	Data Enable				Data	Output Q
		G1	G2	D			
Н	х	Х	х	х	L		
L	L	Х	X	x	Q ₀		
L	↑	Н	X	X	Q ₀ Q ₀ Q ₀		
L	↑ ↑	Х	Н	X	Q_0		
L	↑	L	L	L	L		
L	↑	L	L	Н	н		

When either M or N (or both) is (are) high the output is disabled to the high-impedance state; however, sequential operation of the flip-flops is not affected.

H = High Level (Steady State)

L = Low Level (Steady State)

1 = Low-to-High Level Transition

X = Don't Care (Any Input Including Transitions)

 $\mathbf{Q}_0=\mathbf{The}$ Level of Q Before the Indicated Steady State Input Conditions Were Established.

Absolute Maximum Ratings (Note)

if Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage 7V Input Voltage 7V

Operating Free Air Temperature Range

54LS -55°C to +125°C DM74LS 0°C to +70°C

Storage Temperature Range -65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
